

**Button Membranes**

**Pay close attention to keypads that are designed for manufacturing, but will not build as one assembly in the prototyping process. Button membranes typically range from .008" to .012". This thin membrane will only show up in the Viper HR build style. In the standard build styles you will receive each button as individual pieces. In order for the standard build resolution to build as an assembly, we recommend a membrane thickness of .030".**
